I am a doctoral researcher interested in leveraging **code generation** towards optimising **LM pre-training**, with an emphasis on **function calling** and **multilinguality**, having contributed to multiple **open-source LM releases**. My mission is to unlock the application of LMs beyond text-only settings to areas like **robot navigation** and **agentic workflows** by improving their abilities to **reason**, **offload computation** and learn from **environment feedback**. I also work on **preference learning** methods to improve LMs' code generation capabilities along non-functional axes like **security** and **efficiency**. My interests span all facets of improving LM pre-training efficiency, including **data curation**, **context-length extension**, **modularity** and **sparse-expert models**.
